What do I want to learn or understand better?

We got some feedback from the stakeholder that we took into account when doing this sprint. We had a lot of issues with the git since the third-party application some in the group were using was ignoring our gitignore. I do have the same goal as before. Learning more the aspect of working as a team and the theoretical part. This is something I have felt like I keep getting better at with time.

How can I help someone else, or the entire team, to learn something new?

As I said last week I do have a good understanding on how git works and how to combine different pieces of code. As I said we had a lot of issues that I felt like I could help a lot with.

As I also said last week I am still feeling less confident on the theoretical stuff which I feel as if we as a group have done a very good job with teaching and explaining to each other what someone does not feel as secure about.

What is my contribution towards the team's use of Scrum? What is my contribution towards the team's deliveries?

For this sprint me and Oscar worked on the settingspage. To adapt from what I wanted to learn we once again did a lot on his computer!

We made sure you could remove and add ratings and that these were connected to the whole application. Since we are working separately much of the code has not really been able to fit with each other. So a lot of the work has been focused on the backend where we needed to puzzle a lot together. We also made a page interface so that new pages will follow this and no longer implement the wrong init function.
