What do I want to learn or understand better?

This has been the second scrum week. First sprint went very well. We got some feedback from the stakeholder that we took into account when doing this sprint. Whilst working on the project I also feel as if we worked a lot more together which I feel was a step in the right direction. I would like to keep learning and understanding how to do this. I would still like to learn more about the theoretical aspects of the project like KPI.

How can I help someone else, or the entire team, to learn something new?

I have a very well understanding of git and fxml since I have worked with this before. We had a lot of issues with git since a errror from start that we noticed to late. To fix this we went through with everyone how it worked and what had happened.

For Fxml I have as I said worked with it a lot before. We who have studied It are more used to this as well and in the programming part too. Therefore I think we have all been able to learn from each other

As I also said last week I am still feeling less confident on the theoretical stuff which I feel as if we as a group have done a very good job with teaching and explaining to each other what someone does not feel as secure about.

What is my contribution towards the team's use of Scrum? What is my contribution towards the team's deliveries?

For this sprint me and Oscar worked on the dates. To adapt from what I wanted to learn we did a lot on his computer!

We made sure that pressing dates or buttons it will change the date. And with a observer pattern the observer classes can accurately be notified when the date has changed and instead displays the correct information.
